

BROW LAMINATION

Treatment Information

BEFORE BROW LAMINATION

- Do not use brow growth serums for 3-7 days before your treatment.
- Do not use Retin-A, Retinol products 3-7 days before your treatment.
- Avoid plucking, tweezing, sugaring or waxing.
- Arrive with no makeup on, or be prepared to have it removed by Sara before treatment.
- Do not tint your brows within 3-7 days before, it is best to tint them 1 week after your treatment.

DURING BROW LAMINATION

- Our brow specialist, Sara, will gently clean your skin area, and then she will use a primer that helps prepare the brow hairs for the treatment by making the brows super soft so it is easy to shape them.
- Then a lifting serum is applied to the brow hairs. The processing time for this depends on the coarseness of the hair and how much the direction of the hair needs to change, but it is typically around 3-4 minutes.
- Then a fixing serum is applied to help give your brows their new shape. The brushing is done gently so as not to irritate the skin.
- Once the specialist has shaped your brows to the desired look, she will review your home care regime to ensure you maximize the length of time to preserve your beautiful brows.

AFTER BROW LAMINATION

- Do not rub, pick, or scratch the treated area, as picking can cause trauma to the hairs and force them out of alignment.
- Do not get your brows wet- no use of pools, saunas, steam rooms, hot showers and/or hot baths for 48 hours.
- Do not get your brows sweaty -any dampness can produce poor results, so take it easy on the cardio for 48 hours.
- Do not apply makeup to the brows for 24 hours.
- Do not apply self tanners on the face for 48 hours.
- Do not use Retin-A, Retinol products for 3-7 days after your treatment.
- Wait 48 hours, then each day comb and apply the Brow Balm with a spoolie brow/lash brush
- Understand that your brows were chemically treated and may feel dry. The Brow Balm will help to condition your brows.
- Avoid using chemical skin exfoliants or oily products right on the brows/forehead area very close to the brows. Use of these products will cause premature breakdown of the brow lacquer.
- Examples of products to avoid may include but are not limited to: Glycolic Acid, Hydroquinone, Retinol, Retin A, Vitamin C, Basically, avoid all "peels" or "oily" products along the brow area
